Art Unit: 1745

DETAILED ACTION

Election/Restrictions

1. Restriction to one of the following inventions is required under 35 U.S.C.121:

- Claims 19-24, drawn to a lithium negative electrode having a film coating, classified in class 429, subclass 231.95.
- II. Claims 38-42, drawn to a method of making a battery comprising forming a negative electrode with a protective film, classified in class 429, subclass 215.
- III. Claims 43-47, drawn to a method of making a battery comprising combining the negative and positive electrodes together and then forming a protective film on the negative electrode, classified in class 429, subclass 307.
- 2. The inventions are distinct, each from the other because of the following reasons:
- 3. Inventions II and III are unrelated. Inventions are unrelated if it can be shown that they are not disclosed as capable of use together and they have different modes of operation, different functions, or different effects (MPEP, 806.04, MPEP, 808.01). In the instant case the different inventions, are not disclosed as capable of use together and have different effects such that Invention II treats the lithium anode to form a protective film and then combines with a cathode and a separator to form a battery

Art Unit: 1745

versus Invention III utilizes an electrolyte containing an oxidizing agent additive to form a protective film on the negative electrode after the battery is formed.

- 4. Inventions I and II, III are related as product and process of use. The inventions can be shown to be distinct if either or both of the following can be shown: (1) the process for using the product as claimed can be practiced with another materially different product or (2) the product as claimed can be used in a materially different process of using that product (MPEP 806.05(h)). In the instant case, the product as claimed can be used in a materially different process of using that product such that Invention II treats the lithium anode to form a protective film and then combines with a cathode and a separator to form a battery versus Invention III utilizes an electrolyte containing an oxidizing agent additive to form a protective film on the negative electrode after the battery is formed.
- 5. Because these inventions are distinct for the reasons given above and have acquired a separate status in the art as shown by their different classification, restriction for examination purposes as indicated is proper.
- 6. During a telephone conversation with Mr. James Austin on September 20, 2004, a provisional election was made with traverse to prosecute the invention of Group I, claims 19-24. Affirmation of this election must be made by applicant in replying to this Office action. Claims 38-47 are withdrawn from further consideration by the examiner, 37 CFR 1.142(b), as being drawn to a non-elected invention.

Application/Control Number: 10/645,193

Art Unit: 1745

7. Applicant is reminded that upon the cancellation of claims to a non-elected invention, the inventorship must be amended in compliance with 37 CFR 1.48(b) if one or more of the currently named inventors is no longer an inventor of at least one claim remaining in the application. Any amendment of inventorship must be accompanied by a request under 37 CFR 1.48(b) and by the fee required under 37 CFR 1.17(I).

Page 4

Claim Rejections - 35 USC § 102

7. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

- (b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.
- 8. Claims 19-21, 24 are rejected under 35 U.S.C. 102(b) as being anticipated by Koksbang (5,487,959).

Koksbang teaches a layer for stabilization of lithium anode. Koksbang teaches in column 5, lines 55-60, that an I2/PVP protective coating or layer is formed on the anode. Koksbang teaches in column 6, lines 13-19, 45-50, that the coating protects the anode from reaction with the lithium because I2 reacts with lithium to form LiI.

9. Claims 19 and 24 are rejected under 35 U.S.C. 102(b) as being anticipated by Momyer (4,001,043) or De Jonghe et al. (4,917,974).

Momyer teaches in column 2, lines 26-46, that a hydrous oxide film on the reactive anode when hydrogen peroxide is used.

De Jonghe et al. teaches a lithium anode where a barrier layer is formed on the surface of the lithium anode.

Information Disclosure Statement

10. The information disclosure statement filed 8-20-03 fails to comply with 37 CFR 1.98(a)(2), which requires a legible copy of each foreign patent; each publication or that portion which caused it to be listed; and all other information or that portion which caused it to be listed. It has been placed in the application file, but the information referred to therein has not been considered.

Allowable Subject Matter

11. Claims 22-23 are objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Laura S Weiner whose telephone number is 571-272-1294. The examiner can normally be reached on M-F (6:30-4:00).

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Patrick Ryan can be reached on 571-272-1292. The fax phone number for the organization where this application or proceeding is assigned is 703-872-9306.
